---

## Attendees

Security, Payments Platform Engineering, Engineering Leadership.

## Agenda

1. Follow-up on INC-2026-02-27-004 (duplicate wire transfers) action items.
2. Broader idempotency audit findings.
3. Sign-off requirements for the idempotency key rollout.

## Discussion

Payments Platform presented the design for idempotency key enforcement on the Wire Transfer Service, targeting completion by 2026-03-20 per the incident action item. Security reviewed the design and requested that the idempotency key itself be a client-generated UUID rather than a server-generated sequence, to avoid predictability.

The broader audit (action item 2 from INC-2026-02-27-004) found that the ACH Batch Processor already has natural idempotency via its batch-file submission model, but the mobile app's Instant Transfer feature (SPEC-mobile-instant-transfer) does not currently enforce idempotency keys on its transfer initiation endpoint. This was flagged as a new, separate follow-up item, not blocking the wire transfer fix.

## Decisions

- Wire Transfer Service idempotency key rollout approved as designed, client-generated UUID.
- Instant Transfer idempotency gap added to Payments Platform's Q2 backlog as a medium-priority item (no known incident yet, proactive fix).

## Action Items

1. Payments Platform: ship WTS idempotency enforcement by 2026-03-20 as committed in INC-2026-02-27-004.
2. Payments Platform: scope Instant Transfer idempotency fix for Q2 backlog.
3. Security: add idempotency key coverage as a standing check in the quarterly payments security review going forward.
